WINGZ-DATALINK PROVIDES INSTANT DESKTOP ACCESS TO YOUR CORPORATE DATA

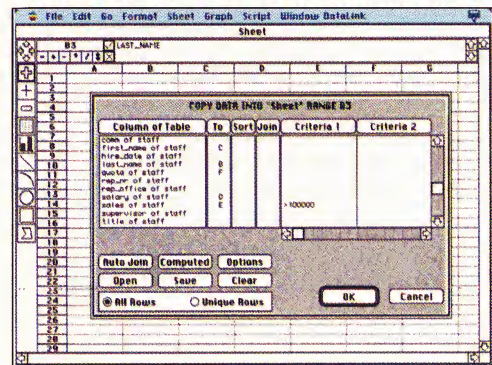

Apply all of the dramatic output of Wingz to your existing data tables.

Just think. By using simple Macintosh® point-and-click features, you can apply the entire set of Wingz' graphic options to your existing corporate data.

Written in HyperScript® (the powerful Wingz programming language), Wingz-DataLink connects users from within Wingz to SQL database management systems. So you can easily locate the information you need to compile a spreadsheet analysis, presentation, or report without leaving your desk.

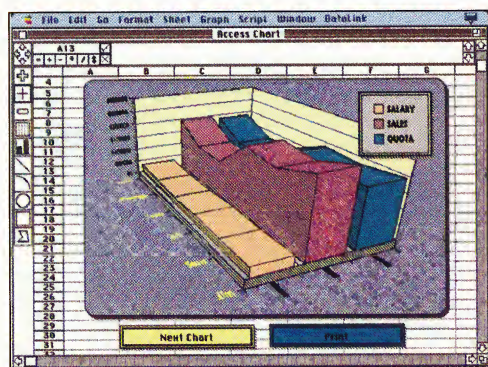

With Wingz-DataLink you don't need to be an SQL expert to query an SQL database—you don't even have to know SQL. Wingz-DataLink gives you complete access to existing data tables by using familiar point-and-click options.

Point-and-click query creation

Corporate Data Access Made Easy as Only Informix Could Do It

Informix is a pioneer in advanced SQL database technology and the innovator of a new generation of personal productivity software. No other single software publisher combines this set of technologies in one company and now in one product. Because we understand the complexities of corporate data management, we can deliver powerful query tools uniquely integrated into our Wingz graphic spreadsheet.

Presentation options applied to query results

Custom information system interfaces

Wingz-DataLink and the HyperScript Language

HyperScript can unleash the full potential of the Apple® Macintosh. Unlike macro languages, HyperScript is a fully-functional, event-driven command language that allows you to build custom applications using the complete array of Macintosh control elements.

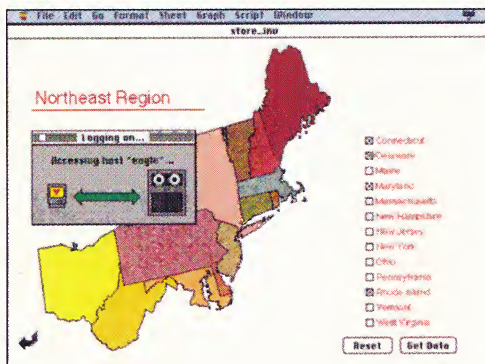

Because HyperScript is an extremely intuitive, English-like programming environment, the time required to create these applications is often substantially less than other programming environments.

WINGZ™

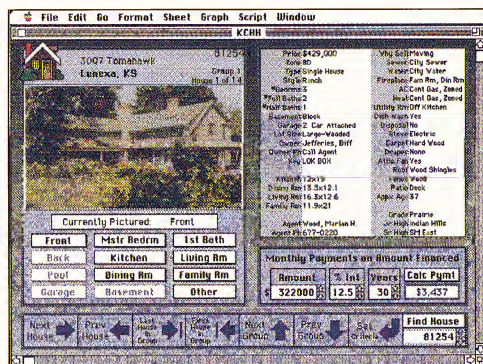

LINK

Turn Your Macintosh into an Executive Information System

Using HyperScript and Wingz-DataLink, a customized interface can be created as a front-end to remote databases. Create vertical market applications or complete Executive Information Systems (EIS) with a transparent, user-friendly window to corporate database resources.

Automated access for desktop EIS

HyperScript applications for INFORMIX-OnLine

Multimedia Capabilities

INFORMIX-OnLine is our mainframe replacement database management system. In addition to the capacity and reliability found only in much more expensive solutions, OnLine can do something no mainframe system can. Its multimedia features allow users to store digitized sounds and images and virtually any other kind of data right in the database.

Using Wingz-DataLink, these images and sounds can be brought directly into the Wingz worksheet. Once inside Wingz, they can be used for additional impact within standard spreadsheets or incorporated into multimedia HyperScript applications.
